Evaluation of Success Criteria:

SUCCESS CRITERION: *These are all the success criteria of the application. When Kelly tested out the app, I made sure she went through all of them, and they ended up being successful.*

1. Successful authentication:

if the user inputs an email that does not already exist, they should get a message saying there is an error. If the user inputs an incorrect password, they should also get a message saying there is an error. If the user successfully inputs the email and password combination that does exist, then they should get to the home page.

2. Account Creation:

Users should be able to create an account by inputting their email, and password, and choosing whether to have a student or tutor acc. App should check whether the passwords match, and give an error if they do not. If students should be directed to different homescreens dependent on whether they chose a student or tutor account

3. Editing Account Details:

Students should be able to edit their name, email, and bio. Tutors should be able to edit all of that as well as the category they are teaching and the specialty subject

4. Exploring For Tutors

Only students should be able to explore for tutors, and not vice versa. Students will have a home page with different subjects, and they should be able to see all the tutors that will teach those subjects

5. Tutor Profile

Once students click on the tutor of their choice, they should be redirected to a tutor profile that displays the tutor's name, specialty subject, and bio. They should also get the option to text the tutor, or book an appointment

6. Chat Room:

This should function like a regular chat room. Students and Tutors should be able to exchange messages with one another.

7. Booking Screen:

The booking screen should be available for students only, and they should be able to input their name, details about the appointment, and use the datepicker tool to pick a date for their appointment.

8. Appointments Screen:

Both tutors and students should have an appointments screen where they can see the appointments they have and what time.

Recommendations for future development

- The first recommendation my client gave me is that users should be able to see the times they scheduled on a calendar so that they can look out for any overlap between dates they scheduled appointments. She stated that although they can see that now itself, it's less visually appealing. She also stated that the app should provide an option to delete appointments in case a user sends something on accident. Finally, my client said I should adjust the app to be usable on desktop as well. Currently it is, but the aesthetics are much worse horizontally, and creating a whole new version of the app to fit the desktop screen would be at least another 2-5 hours of work, but it would be worth it
